0		with the SSVersion field (or the first octet following
		SSLength if it is not defined as SSVersion) and ending with
		the second(last) octet of the Next Ethertype field. Min is 2
	•	and max is 65535.
LSVersion	, 1 octet / / / /	Version number of the following protocol information
Data	LSLength-3 octets///	LSType protocol dependent data
Next Ethertype	2 octets	Ethertype/length of next layer protocol, 0 if none.
Pad / / //	42-0 octets / ///	pad to minimum size if needed
FCg / /	4 octets / ///	Frame Check Sequence

F/6, 38

Field	Length	Meaning
DA	6 octets	Destination Address
SA	6 octets	Source Address
Ethertype	2 octets	0x886c (Link Control Frame)
SSType	I octet	=1
SSLength	1 octet	Number of additional octets in the control header, starting with the SSVersion field and ending with the second(last) octet of the Next Ethertype field. The minimum value of SSLength is 8 for SSVersion 0.
SSVersion	1 octet	=0
OpCode	1 octet	Operation code for this control message.
NumBands	I octet	Number of bands specified in this control. Each band has a two octet descriptor. The first band refers to 2 MBaud modulation rate, the next to 4 MBaud. NumBands shall be 1 or 2 on transmission for 10M8 stations, and stations shall ignore band entries beyond Band2 on receive if
NumAddr	1	NumBands is larger than 2. The value 0 is not allowed.
Numari in the state of the stat	1 octet	Number of addresses specified in the payload of this control message. NumAddr may be zero. The SA in the Ethernet header is always used, and is referred to in the following sections as RefAddr0.
Bandl_PE	1 octet	2MBaud, 7 MHz carrier: The PE value that should be used to send data when the 2MBaud band is selected. (18) are the only valid values. The value 8 is used to request HPNA 1.0 type frames, and is valid only when the network is operating in V1M2mode, and only in Band1.
Bandl_rank	1 octet	The rank order of the ReqDAs' preference for this band, 1 is highest preference, and the other bands are assigned successively larger rank values, no two bands shall have the same rank
Band2_PE	1 octet	Optional, only present if NumBands >= 2. 4MBaud, 7 MHz carrier: If included, this field is the PE value that should be used to send data when the 4MBaud band is selected. (0, 915) are the only valid values.
Band2 rank	1 octet	Optional only present if NumBands >= 2. Rank order of ReqDAs' preference for this band
RefAddr L	6 octets	Optional. Present if NumAddr >= 1. The second MAC Address for which the rates are being specified, typically Broadcast or a multicast address.
TO A SOUTH	6 octets	Optional. Present if NumAddr >= 2. The third MAC Address for which the rates are being specified.
****		[additional instances of RefAddr, until the number of RefAddr fields equals NumAddr]
Next Ethertype	2 octets	=0.
Pad		To reach minFrameSize if required
FCS	4 octets	Frame Check Sequence

F16, 39

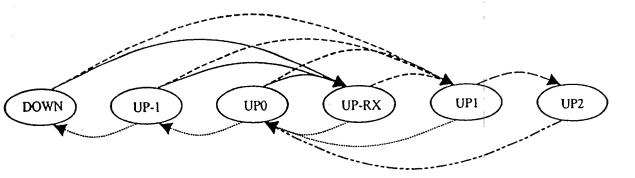

PE	Data Rate	Meaning
0	N/A	Means this band is Not Supported
i	4 Mbit/s	2 Mbaud FDQAM, 2 bits per Baud
2	6 Mbit/s	2 Mbaud FDQAM, 3 bits per Baud

4	10 Mbit/s	2 Mbaud FDQAM, 5 bits per Baud
5	12 Mbit/s	2 Mbaud FDQAM, 6 bits per Baud
6	14 Mbit/s	2 Mbaud FDQAM, 7 bits per Baud
7	16 Mbit/s	2 Mbaud FDQAM, 8 bits per Baud
8	1 Mbit/s	HPNA 1.0
9	8 Mbit/s	4 Mbaud QAM, 2 bits per Baud
10	12 Mbit/s	4 Mbaud QAM, 3 bits per Baud
11	16 Mbit/s	4 Mbaud QAM, 4 bits per Baud
12	20 Mbit/s	4 Mbaud QAM, 5 bits per Baud
13	24 Mbit/s	4 Mbaud QAM, 6 bits per Baud
14 -	28 Mbit/s	4 Mbaud QAM, 7 bits per Baud
15	32 Mbit/s	4 Mbaud QAM, 8 bits per Baud

F16. 40

OpCode	Meaning	
0	Rate Change Request	
1	Rate Test Request	
2	Rate Test Reply	 -
3-255	Reserved	

band specification	A Payload Encoding (PE) and Rank associated with a given band. A band is a single combination of baud rate, modulation type (e.g. QAM or FDQAM) and carrier frequency. Two bands are defined in HPNA VZ
Logical channel, channel	A flow of frames from a sender to one or more receivers on a single network segment, consisting of all the frames with a single combination of DA and SA.
Receiver	A station that receives frames sent on a particular channel. If the destination is a unicast address there is at most one receiver. If the destination is a group address (including broadcast), there may be many receivers.
Receiver PE	The preferred PE to be used on this channel, as determined by the receiver.
RRCF	Rate Request Control Frame. Sent from the receiver to the sender to effect a change in PE.
RefAddr0	The SA in the Ethernet header of the RRCF frame. This is the DA of the receiver (for the channel), and is always used by the channel sender as the first RefAddr processed.
RefAddr1RefAddr <n></n>	Other addresses including Broadcast and Multicast addresses for which the receiver is indicating rate information to the sender. The channel receiver's station address (RefAddr0) should not be put in the list of additional RefAddr's. Notel: At least one RefAddr field is necessary to support rate negotiation for Broadcast and Multicast addresses since these cannot be used as the
Sender	The sending station for a channel, usually the station owning the source
-	MAC address.
Sender PE	The preferred PE associated with a channel, as noted by the sender.

			0x001 - HPNA1.0
			0x010 - iLine10
			0x011-0x111 Reserved
-J			

DeleteSet	A computed value used to detect newly removed status information.
NewRxFlags, ReallyNewRxFlags	Computed values used to detect new status flags.

F16. 47

timer is cancelled if a second CSA is sent as a result of the CSF_11mer explining.	CSP_Timer RetransmitTimer	A free-running timer with a period of 60 seconds. A one-shot timer, set to a random interval in the range 1 ms to 1000 ms, inclusive, after sending a CSA in which CSA_CurrentTxSet and CSA_OldestTxSet are different, or when a CSA is received with the CSA_Opcode set to 1 (Request). This
		timer is cancelled if a second CSA is sent as a result of the CSF_11mer explining.

F16, 48

NewTxSet	The set of flags announced during the current CS period, updated immediately when a new link layer priority is used or new volatile status is set. When the CSP_Timer expires, CurrentTxSet is given the value of NewTxSet, and NewTxSet is reset to the default set.
PreviousTxSet	The set of flags that were announced during the previous CS period (the ending value of NewTxSet from the previous CS period).
OldestTxSet	The set of flags rolled over from PreviousTxSet at the end of the previous CS period (the value of PreviousTxSet from the previous CS period). Flags that are present in OldestTxSet and missing from PreviousTxSet were not actively used or detected (by the sender) for an entire CS period, and will be deleted. This set is sent in CSA frames as CSA_OldestTxSet.
NewRxSet	The union of all CSA_CurrentTxSet flags received in CSAs from other stations during the current CS period. This is rolled over into PreviousRxSet at the expiration of the CSP_Timer, then reset to the empty set (0).
	A volatile status flag (one of the priority flags) in this set may subsequently be deleted if the only station previously announcing that flag stops using it. The deletion from that station's CurrentTxSet is noted by the difference from its OldestTxSet. The fact that it was the only sender is noted by the absence of the flag in that station's CurrentRxSet, indicating that it has received the flag from no other stations.
	If deleted from NewRxSet, a flag shall also be deleted from PreviousRxSet.
PreviousRxSet	The set of announced flags received during the previous CS period (the ending value of NewRxSet from the previous CS period). A flag may be deleted from this set, as described under NewRxSet above.

FIG. 49

CurrentTxSet	The set of flags that were announced during the previous CS period plus any new status and priority flags (or changed configuration/options flags) used during the current CS period, i.e. the union of PreviousTxSet and NewTxSet. This set is sent in
	CoA trames as Con-Current Access to the continuous as the continuo
CurrentRxSet	The union of NewKxSet, FreviousKxSet. 1 nis set is sent in CSP in mind and CSP
CurrentInUseSet	The union of CurrentTxSet and CurrentRxSet. This set is used to determine the
	operational mode of the station and to modify the mapping between the LL phority
•	of the frame and the actual PHY priority usage.

Octet	Field	Length	Meaning
Flags and the first of the firs	LARQ_Mult	1 bit	Multiple Retransmission Flag. 0 in the original transmission of a data frame. For retransmitted frames (LARQ_Rtx = 1), set to the value of LARQ_Mult in the NACK frame that caused the retransmission. This flag can be used by receivers to measure the round-trip times associated with the miss/nack/receive-rtx process.
	LARQ_Rtx	1 bit	O for first transmission of a frame, 1 if frame is retransmitted. Stations not implementing LARQ shall drop any data frame if this bit is 1.
	LARQ_NoRtx	1 bit	0 if implementation supports retransmission, 1 if only priority is meaningful. May be used on a perchannel basis
	LARQ_NewSeq	1 bit	1 if the sequence number space for the channel has been reset, and older sequence numbers should not be nacked, 0 otherwise
	LARQ_Ctl	1 bit	"0" when in Encapsulation Format
	Priority	3 bits	Link Layer Priority of this frame
Flags1_Seq0	Reserved	4 bits	Reserved, shall be 0
	LARQ_seq_high	4 bits	High 4 bits of Sequence number
Seq1	LARQ_seq_low	8 bits	Low 8 bits of Sequence number

FG. 52C

ontrol frame	A frame generated by a LARQ protocol module that contains only a LARQ protocol header as its payload.
Current sequence number	The most recently received new sequence number for a channel.
Data frame	Any standard Ethernet frame from higher (than LARQ) protocol layers. A LARQ-enabled station encapsulates the original payload of an Ethernet frame by inserting a LARQ header (short form control header with LARQ_hdr data) between the source address and the remainder of the frame before the frame is passed down to the driver for transmission on the network.
Forget timer	An implementation dependent mechanism to allow a receiver to reset the sequence number space of a channel when a received sequence number is not the next expected (Current Sequence Number + 1). One second is a suggested default value.
nold timer, lost timer	An implementation dependent timing mechanism that limits the time a receiver will hold onto a received frame while waiting for a missing frame to be retransmitted. Conceptually, there is one such timer per missing sequence number. The timer interval is Maximum Hold Interval.
ogical channel, channel	A flow of frames from a sender to one or more receivers on a single network segment consisting of all the frames with a single combination of destination address, source address, and link layer priority.
NACK; Nack, nack	An indication from a receiver to a sender requesting retransmission of one or more frames. Also, the action of providing such an indication. E.g. "to nack a sequence number" meaning to send a NACK indication.
VACK±timer	An implementation dependent timing mechanism used by a receiver to retransmit NACKs for missing sequence numbers. Conceptually, there is one such timer per missing sequence number per logical channel. The timer is reset each time a NACK is sent for a sequence number. The timer interval is NACK Retransmission Interval.
new	A new sequence number is one whose difference from the current sequence number for the channel, modulo the size of the sequence number space and considered as a signed integer, is greater than 0. In particular, the numbers (current + 1) through (current + 2047).
old	An old sequence number is one whose difference from the current sequence number for the channel, modulo the size of the sequence number space and considered as a signed integer, is less than or equal to 0. In particular, the numbers (current - 2048) through (current) are old. Note, however, that most of the old sequence numbers are also out-of-sequence.

F16. 52f.1

ADDRESS AND ADDRES	
out of sequence	Any sequence number that falls outside a reasonable range, old or new, of the current sequence number for a logical channel is considered out of sequence. It is recommended that plus or minus twice the value of MaximumSaveLimit (defined below) be used as the "reasonable range" when checking for out of sequence.
receiver	A station that receives frames sent on a particular channel. If the destination address is a unicast address there is at most one receiver. If the destination address is a group address (including broadcast), then there may be many receivers.
reminder	A control frame sent by the channel sender with the most recently used sequence number for a channel which has been inactive for Reminder Interval after its most recent data frame.
renfinder timer	An implementation dependent timing mechanism used by a sender to generate a reminder frame after a period of inactivity for a channel. The timer is reset each time a new data frame is transmitted. Conceptually, there is one such timer per channel. The timer interval is Reminder Interval.
savetimer	An implementation dependent timing mechanism that limits the time a sender will save a frame waiting for retransmission requests. The timer interval is Maximum Save Interval.
sender	The sending station for a channel, usually the station owning the source MAC address.
sequence numbers	Sequence numbers are maintained separately for each logical channel by the sender.

F16. 52f.z

Send Sequence Number	The sequence number of the most recently transmitted data frame.
Reminder Timer Interval	A fixed interval. The default is 50 ms. Lower values will increase the overhead of reminders on network load, while higher values increase the
	latency for end-of-sequence frames requiring retransmission. Implementations should not use values outside of the range 25-75 ms, based on 150 ms maximum save and hold times.
Minimum Retransmission Interval	An interval used to prevent too-frequent retransmissions of a single frame. Most important for multicast channels. The default is 10 ms.
Maximum Save Limit	The maximum number of frames that will be saved for a single logical channel. This is implementation dependent, and varies with the maximum
	frame rate the sender is expected to support. Values of 100 or more can be useful for high-speed applications such as video.
Maximum Save Interval	The maximum time that the sender will normally save a frame for possible retransmission. The default is 150 ms.

F16, 53

Current Sequence Number	The most recent sequence number received in a LARQ header for the channel, whether in a data frame or a reminder control frame.
Oldest missing sequence number	The oldest sequence number for a frame not yet received which has not been declared lost.
Maximum Hold Interval	The longest interval that a frame will be held awaiting an earlier missing frame. The default is to use the same value as Maximum Save Interval, which has a default of 150 ms
Maximum Receive Limit	The maximum number of frames that a receiver will buffer while awaiting an earlier missing frame. The default should normally be the same as the Maximum Save Limit.
NACK Retransmission Interval	The interval after which a receiver will retransmit a Nack control frame for a missing sequence number, with the expectation that earlier Nack control frames or data frame retransmissions were lost. The default for fixed
	implementations is 20 ms.

And the property of the proper

Field	<u>Lengt</u> <u>h</u>	Meaning
DA	6 octet s	Destination Address
SA	6 octet s	Source Address
Ethertype	2 octet s	(TBD) = VOHN Link Control Frame - new IEEE assignment
Туре	2 octet s	2 = Timestamp Report Message
Length	2 octet s	Number of additional octets in the signaling frame, starting with Version field and ending with the last octet of the Data Payload field. Minimum is 2.
Version	2 octet s	= 0
TSMSeqNum	2 octet s	Sequence number of TSM to which the Timestamp in this message is applicable.
Timestamp	4 octet s	Timestamp of a previously transmitted Timestamp Report Message, corresponding to TSMSeqNum.
Frequency	2 octet s	Resolution of the timestamp and Gtimestamp fields, in ticks/1.000ms. For example, value 32768 corresponds to one clock tick at 32.768Mhz, in which the LSBit of the Timestamp corresponds to a time of 0.030517578125usec. The Timestamp will rollover every 131 seconds = 2.2 minutes
NumGrants	2 octet s	Number of Grant Timestamps specified in the payload of this control message. NumGrants may be zero. Each grant timestamp is accompanied by a Line ID and Call ID field. Including the Grant Timestamp, the total for each grant timestamp is 8 bytes.

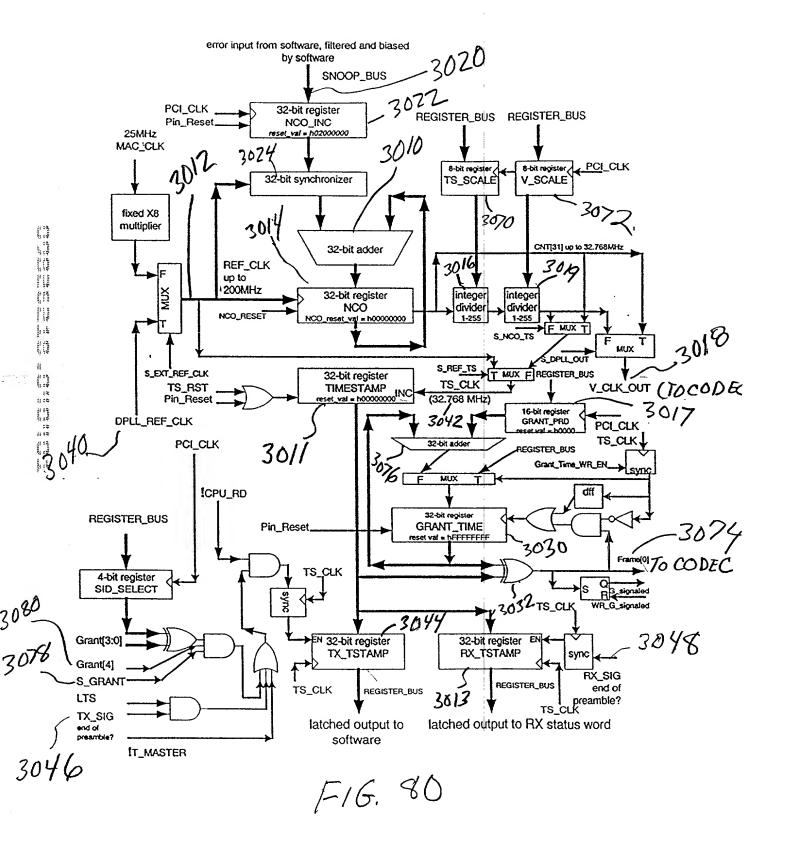

FIG. 77(1)

Line ID	2 octet s	Identifier of the Line termination associated with the immediately following GTimestamp.
Call ID	2 octet s	Identifier of the call instance on the Line termination associated with the immediately following GTimestamp.
GrantTimest amp	4 octet s	Grant Timestamp corresponding to the immediately preceding Line ID. This is the time at which the Proxy Gateway wishes to receive a future constant bit rate service flow packet in order to minimize delivery latency to subsequent delivery to a synchronous network. The time value corresponds to the time at the timing master. Additional packets for the identified service flow are expected to arrive at periodic intervals measured from this time.
•••		additional instances of {Line ID, Call ID, Grant Timestamp} field tuples
Pad		Any value octet
FCS	4 octet s	Frame Check Sequence

F16,839

Bit locations	Field name	Description
7-3	Reserved	
2	TsReset	When set to 1, forces timestamp register to value of 0x00000000. When set to 0, allows timestamp register to increment by one for each detected DPLL_REF_CLK rising edge.
1	SGrant	When set to 1, causes timestamp to be latched into txTimeStampHigh and txTimeStampLow registers whenever the value of tscSID matches the value of input pins Grant[3:0] and Grant[4] is asserted. When set to 0, disables txTimeStampHigh and txTimeStampLow latching under the stated conditions.
0	TMaster	When set to 1, enables txTimestampHigh and txTimestampLow registers to be latched with timestamp values at times determined by frame transmissions (through the LTS descriptor bit) or grant events (through the sGrant descriptor bit). When set to 0, enables txTimestampHigh and txTimestampLow registers to be latched with timestamp values at times determined by txTimeStampHigh and txTimeStampLow register read accesses.

Default value of this register is 0x05

F16,836

Bit locations	Field name	Description
7-4	Reserved	
3-0	SID	SID value that is to be matched by Grant[3:0] pins in order to cause a grant timestamp value to be latched. When the Grant[3:0] pins match the SID value and the Grant[4] input is 1 and the sGrant register bit is 1, then the current timestamp value will be latched into the txTimeStampHigh and txTimeStampLow registers.

Default value of this register is 0x00

Bit locations	Field name	Description
15-0	txTimeStampL ow	Least significant 16 bits of the latched tx timestamp value

Default value of this register is undefined.

F16.83 d

Bit locations	Field name	Description
15-0	txTimeStampH igh	Most significant 16 bits of the latched tx timestamp value

Default value of this register is undefined.

	_	
<u>Field</u>	<u>Length</u>	Meaning
DA	6 octets	Destination Address (FF.FF.FF.FF.FF)
SA	6 octets	Source Address
Ethertype	2 octets	0x886c (HPNA Link Control Frame)
SSType	1 octet	= TBD
SSLength	1 octet	Number of additional octets in the control header, starting with the SSVersion field and ending with the second (last) octet of the Next Ethertype field. Minimum is 16.
SSVersion	1 octet	= 0
TRM_type	1 octet	Value of x00 means that this is a TRM containing a valid timestamp. Value of x01 means that the master does not have a valid clock and slaves should give local indication that they are no longer locked to a master reference. Value of x80 means that this is a TQM. Value of x81 means that this is a TSM. All other values are reserved.
TRMSeqNum	2 octets	Timestamp Report Message Sequence Number for this message. Sequence number of x0000 indicates an initial TRM, implying that Timestamp and PrevTRMSeqNum are both invalid.
PrevTRMSeqNu m	2 octets	Sequence number of TRM to which the Timestamp in this message is applicable. The value of PrevTRMSeqNum is not necessarily equal to TRMSeqNum minus one. PrevTRMSeqNum is set to x0000 for the first TRM of a TRM pair.

F16. 85(1)

Field	Length	Meaning
Timestamp	4 octets	Timestamp of a previously transmitted Timestamp Report Message, corresponding to PrevTRMSeqNum. The LSBit of the Timestamp corresponds to a time of $0.030517578125\mu \text{sec} = \text{one clock tick at } 32.768\text{MHz}$. The Timestamp will rollover every 131 seconds = 2.2 minutes.
NumSlots	1 octet	Number of Slot Timestamps specified in the payload of this control message. NumSlots may be zero. Each Slot Timestamp is accompanied by a MACAddr, and Channel_ID field. Including the Slot Timestamp, each Slot Timestamp is 12 bytes long.
PAD_0	3 octets	Padding to align to a 32-bit boundary. Always present, even when NumSlots has the value of 0.
MACAddr	6 octets	MAC Address associated with the immediately following Channel_ID and STimestamp.
Channel_ID	2 octets	Identifier for a channel associated with the immediately preceding MACAddr.
STimestamp	4 octets	Slot Timestamp corresponding to the immediately preceding Channel_ID. This is the time at which the TRM sender wishes to receive a future constant bit rate service flow packet in order to minimize overall latency of delivery to a synchronous network. The time value corresponds to the time at the timing master. Additional packets for the identified service flow are expected to arrive at periodic intervals measured from this time. The LSBit of the STimestamp corresponds to a time of $0.030517578125\mu sec = one clock tick at 32.768MHz$.
MACAddr	6 octets	MAC Address associated with the immediately following Channel-ID and STimestamp.
Channel_ID	2 octets	Identifier for a channel associated with the immediately following Channel_ID and STimestamp.

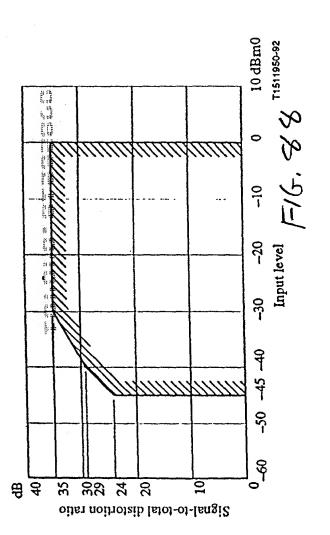

Field	Length	Meaning
STimestamp	4 octets	Slot Timestamp corresponding to the immediately preceding Channel_ID. This is the time at which the TRM sender wishes to receive a future constant bit rate service flow packet in order to minimize overall latency of delivery to a synchronous network. Additional packets for the identified service flow are expected to arrive at periodic intervals measured from this time. The LSBit of the STimestamp corresponds to a time of 0.030517578125µsec = one clock tick at 32.768 MHz.

DECLARATION AND POWER OF ATTORNEY FOR PATENT APPLICATION

PATENT

Docket No.: 42141/RJP/E264

As a below named inventor, I hereby declare that:

My residence, mailing address and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled A METHOD FOR PROVIDING DYNAMIC ADJUSTMENT OF FRAME ENCODING PARAMETERS IN A FRAME-BASED COMMUNICATIONS NETWORK, the specification of which is attached hereto unless the following is checked:

__ was filed on __ as United States Application Number or PCT International Application Number __ and was amended on __ (if applicable).

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment specifically referred to above.

I acknowledge the duty to disclose information which is material to patentability as defined in 37 CFR § 1.56, including for continuation-in-part applications, material information which became available between the filing date of the prior application and the national or PCT international filing date of the continuation-in-part application.

I hereby claim foreign priority benefits under 35 U.S.C. § 119(a)-(d) or § 365(b) of the foreign application(s) for patent or inventor's certificate, or § 365(a) of any PCT International application which designated at least one country other than the United States of America, listed below and have also identified below, any foreign application for patent or inventor's certificate, or any PCT International application having a filing date before that of the application on which priority is claimed.

Prior Foreign Application(s)

Application Number Country

Filing Date (day/month/year) Priority Claimed

I hereby claim the benefit under 35 U.S.C. § 119(e) of any United States provisional application(s) listed below.

Application Number Filing Date
